

AgileVoice Network Layouts

The following are several example network layouts implementing AgileVoice and SER or Asterisk, as well SER/Asterisk hybrids.

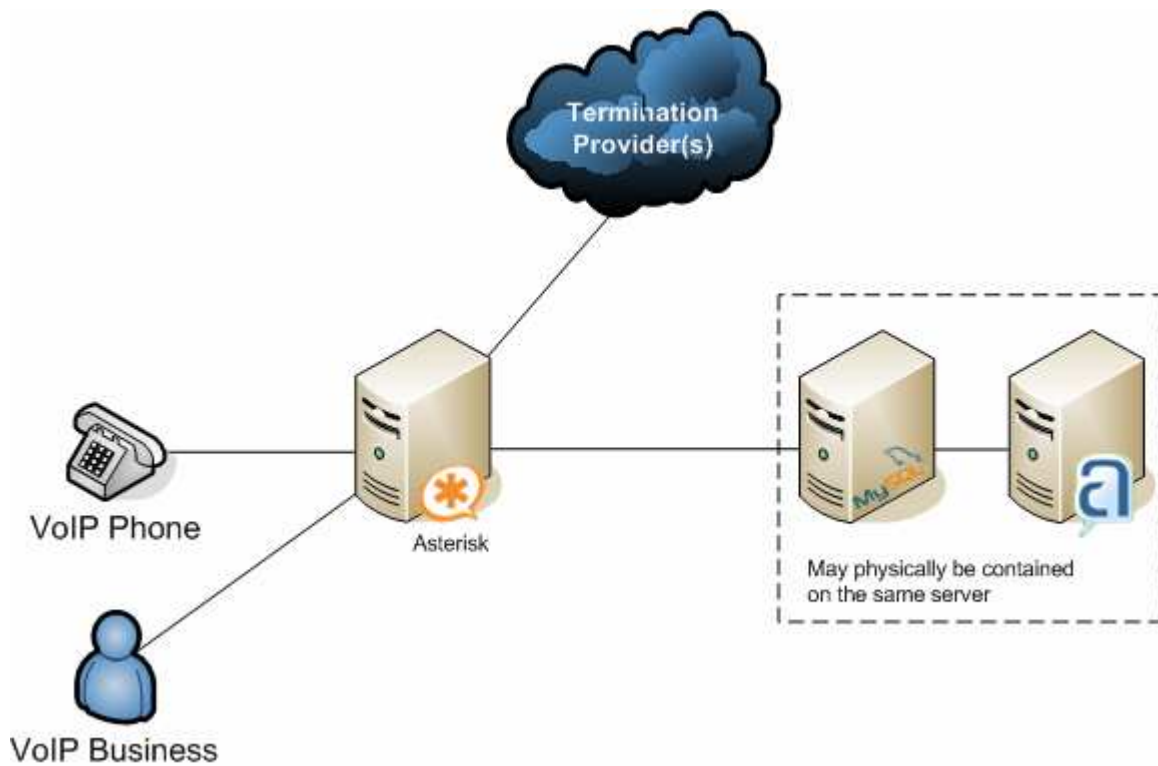

While SER has the power to scale far beyond levels possible on an Asterisk-only network, SER is currently lacking some advanced features that Asterisk can deliver.

Our solution is to meld the two systems together as needed on a case-per-case basis in order to deliver the required billing and provisioning features without sacrificing in equally critical areas of redundancy and scalability.

Each of the following network layouts can serve as a roadmap - they have been designed for several of our clients' unique needs and are implemented in live environments. However, these layouts can be modified as needed to suite your needs and are not presented as the only possible network configuration options suitable for implementing AgileVoice.

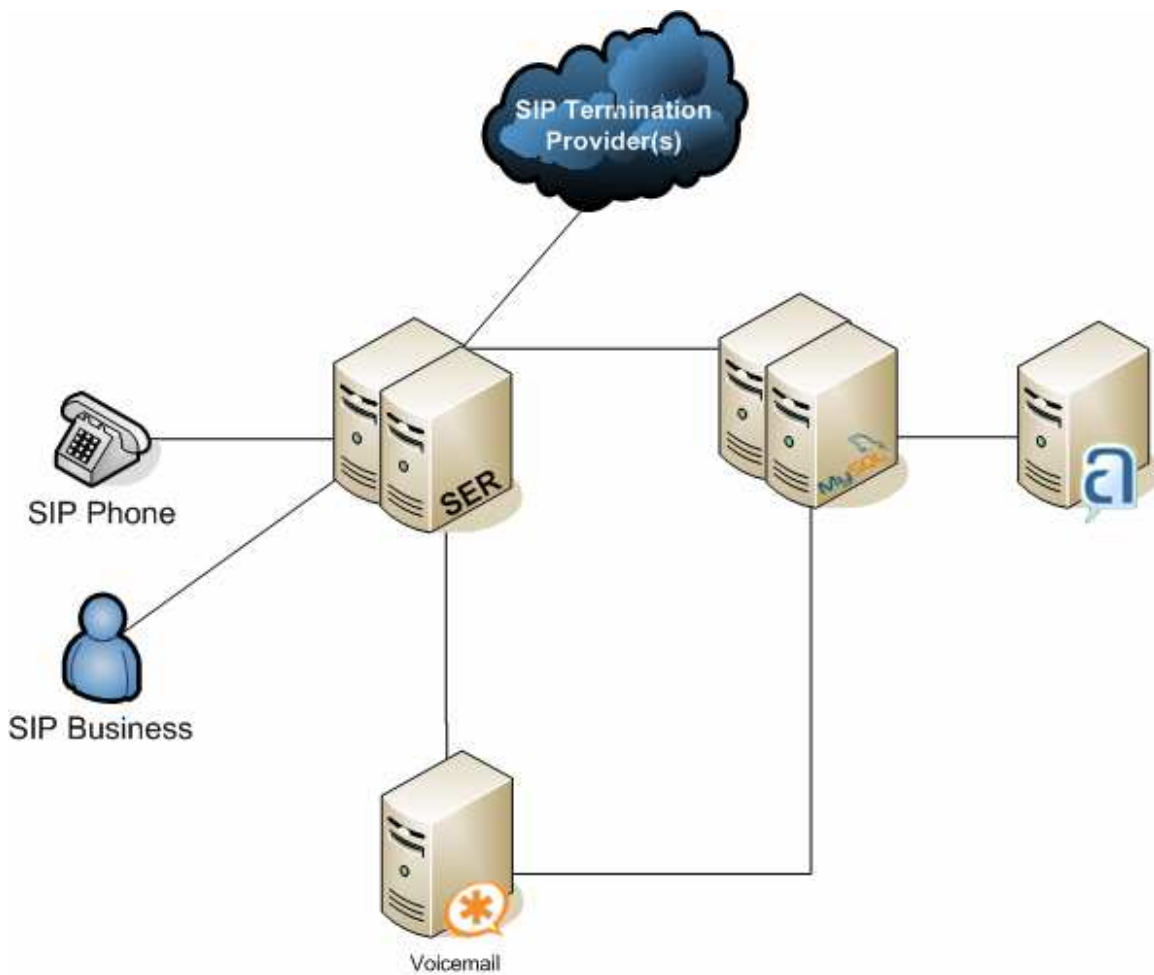

Asterisk-only Network Layout

SER Pure SIP Network Layout

SER + Asterisk Network Layout
